Abstract

Gastro-Care is a web-based AI-driven digestive health assistant designed to support users in understanding and managing common digestive system problems. The system provides features such as a multilingual conversational chatbot, rule-based symptom analysis, personalized digestive health guidance, and emergency alert detection. Unlike traditional health information platforms that mainly offer static and generic content, Gastro-Care focuses on interactive communication, early risk identification, and safe AI-based decision support. The system classifies digestive health issues into guidance, awareness, and emergency categories to ensure timely and appropriate user response. The project follows a structured development methodology to ensure systematic design, reliable implementation, and proper documentation at each stage.

Background of the Project

Digestive health problems such as gas, acidity, constipation, and stomach pain are very common and affect people of all age groups. However, many individuals lack proper understanding of their symptoms and are often unable to decide whether their condition is minor or requires medical attention. Most existing health platforms provide generic information and do not offer interactive or personalized guidance. Language barriers further limit users from clearly communicating their health concerns. With the advancement of artificial intelligence technologies, it is now possible to develop intelligent conversational systems that can analyze user input, provide personalized guidance, and detect emergency symptoms in real time. This project aims to utilize these AI technologies to create a smart, safe, and multilingual digestive health assistant that improves health awareness and supports timely decision-making.

Problem Statement

Traditional digestive health information systems suffer from several limitations. Users often receive generic advice that does not consider individual symptoms, lifestyle, or medical history. Many people find it difficult to determine whether their digestive problems are mild or require medical attention. Language barriers further prevent effective communication of health concerns. In addition, the lack of interactive guidance and emergency symptom detection increases the risk of delayed medical action. These limitations reduce user awareness, safety, and confidence in managing digestive health issues.

Solution Overview

The proposed Gastro-Care system introduces an AI-based multilingual conversational chatbot to provide intelligent digestive health assistance. The system collects user symptoms through interactive questioning and analyzes them using a rule-based artificial intelligence approach. It provides personalized guidance for common digestive issues, raises awareness for chronic conditions, and detects emergency symptoms in real time. User profiles and chat history are maintained to support continuity and personalized interaction. The system aims to improve digestive health awareness while ensuring medical safety through controlled and explainable AI decision-making.

Objective of the project

General Objective:
To develop an intelligent and safe AI-based digestive health assistant that provides personalized guidance, health awareness, and emergency alerts through conversational interaction.

Specific Objectives:

- To design a multilingual conversational chatbot for digestive health assistance.
- To analyze user-reported digestive symptoms using a rule-based AI approach.
- To classify digestive health issues into guidance, awareness, and emergency categories.
- To provide personalized digestive health guidance based on user input and history.
- To detect emergency digestive symptoms and generate timely alerts.

Scope of the project

The project focuses on developing a web-based AI-driven digestive health assistant for users seeking guidance related to digestive system problems. It covers user profile management, multilingual conversational interaction, symptom analysis, rule-based AI decision-making, and emergency alert detection. The system is designed to provide guidance and health awareness while maintaining medical safety boundaries. Future enhancements may include advanced natural language processing, machine learning-based symptom prediction, and mobile application support.

Methodology

The Waterfall Methodology is adopted for the development of the Gastro-Care system. The project development process includes requirement analysis, system design, implementation, testing, and deployment. Each phase is completed sequentially to ensure clarity, reliability, and proper documentation. This structured approach supports the safe and systematic implementation of a rule-based AI system in the healthcare domain.

Development Tools

Activities	Tools / Programs
Client-side coding	React.js
Client-side styling	Boot-Strap
Backend development	Node.js with Express.js
Database server	MongoDB
AI logic implementation	Rule-Based AI (JavaScript)
Platform	Windows
Web server	Local Host
Browsers	Google Chrome
Documentation	MS Word

Table1

Expected Outcomes

- **Improved patient engagement through personalized digestive care plans**
  Provides customized diet recommendations, reminders, and guidance based on individual conditions.
- **Reduced administrative workload for clinics and healthcare staff**
  Automates scheduling, reporting, and record-keeping, minimizing manual tasks.
- **Instant medical assistance through an AI-based Gastro-Care chatbot**
  Offers quick responses to digestive health queries, symptom guidance, and general medical support

Conclusion

This project aims to enhance digital healthcare services by introducing intelligence, security, and automation into traditional medical management systems. The **AI-Driven Gastro-Care System** improves the quality of digestive healthcare by enabling efficient patient management, personalized treatment guidance, and instant medical assistance. By reducing manual workload for healthcare staff and improving patient engagement, the system ensures a better overall healthcare experience for both patients and medical professionals.
